Ecofeminism and Feminist Theory

CAROLYN MERCHANT

The term ecofeminism was coined by the French writer Françoise d'Eaubonne in 1974 to represent women's potential for bringing about an ecological revolution to ensure human survival on the planet. Such an ecological revolution would entail new gender relations between women and men and between humans and nature. Liberal, radical, and socialist feminism have all been concerned with improving the human/nature relationship, and each has contributed to an ecofeminist perspective in different ways. Liberal feminism is consistent with the objectives of reform environmentalism to alter human relations with nature through the passage of new laws and regulations. Radical ecofeminism analyzes environmental problems from within its critique of patriarchy and offers alternatives that could liberate both women and nature. Socialist ecofeminism grounds its analysis in capitalist patriarchy and would totally restructure, through a socialist revolution, the domination of women and nature inherent in the market economy's use of both as resources. While radical feminism has delved more deeply into the woman/nature connection, I believe that socialist feminism has the potential for a more thorough critique of the domination issue.

Liberal feminism characterized the history of feminism from its beginnings in the seventeenth century until the 1960s. Its roots are liberalism, the political theory that incorporates the scientific analysis that nature is composed of atoms moved by external forces with a theory of human nature that views humans as individual rational agents who maximize their own self-interest and capitalism as the optimal economic structure for human progress. Historically, liberal feminists have argued that women do not differ from men as rational agents and that exclusion from educational and economic opportunities have prevented them from realizing their own potential for creativity in all spheres of human life.

For liberal feminists (as for liberalism generally), environmental problems result from the overly rapid development of natural resources and the failure to regulate environmental pollutants. Better science, conservation, and laws are the proper approaches to resolving resource problems. Given equal educational opportunities to become scientists, natural resource managers, regulators, lawyers, and legislators,

Worldview Arguments for Environmentalism  59
women like men can contribute to the improvement of the environment, the conservation of natural resources, and the higher quality of human life. Women, therefore, can transcend the social stigma of their biology and join men in the cultural project of environmental conservation.

Radical feminism developed in the late 1960s and 1970s with the second wave of feminism. The radical form of ecofeminism is a response to the perception that women and nature have been mutually associated and devalued in Western culture and that both can be elevated and liberated through direct political action. In prehistory an emerging patriarchal culture dethroned the mother Goddesses and replaced them with male gods to whom the female deities became subservient.¹ The scientific revolution of the seventeenth century further degraded nature by replacing Renaissance organismism and a nurturing earth with the metaphor of a machine to be controlled and repaired from the outside. The Earth is to be dominated by male-developed and -controlled technology, science, and industry.

Radical feminism instead celebrates the relationship between women and nature through the revival of ancient rituals centered on Goddess worship, the moon, animals, and the female reproductive system. A vision in which nature is held in esteem as mother and Goddess is a source of inspiration and empowerment for many ecofeminists. Spirituality is seen as a source of both personal and social change. Goddess worship and rituals centered around the lunar and female menstrual cycles, lectures, concerts, art exhibitions, street and theater productions, and direct political action (web weaving in anti-nuclear protests) are all examples of the re-visioning of nature and women as powerful forces. Radical ecofeminist philosophy embraces intuition, an ethic of caring, and weblike human/nature relationships.

For radical feminists, human nature is grounded in human biology. Humans are biologically sexed and socially gendered. Sex/gender relations give men and women different power bases. Hence the personal is political. Radical feminists object to the dominant society’s perception that women are limited by being closer to nature because of their ability to bear children. The dominant view is that menstruation, pregnancy, nursing, and nurturing of infants and young children should tie women to the home, decreasing their mobility and inhibiting their ability to remain in the work force. Radical feminists argue that the perception that women are totally oriented toward biological reproduction degrades them by association with a nature that is itself devalued in Western culture. Women’s biology and nature should instead be celebrated as sources of female power.

Turning the perceived connection between women and biological reproduction upside down becomes the source of women’s empowerment and ecological activism. Women argue that male-designed and -produced technologies neglect the effects of nuclear radiation, pesticides, hazardous wastes, and household chemicals on women’s reproductive organs and on the ecosystem. They argue that radioactivity from nuclear wastes, power plants, and bombs is a potential cause of birth defects, cancers, and the elimination of life on Earth.¹ They expose hazardous waste sites near schools and homes as permeating soil and drinking water and contributing to miscarriage, birth defects, and leukemia. They object to pesticides and herbicides being sprayed on crops and forests as potentially affecting children and the childbearing women living near them. Women frequently spearhead local actions against spraying and power plant

60  Ecofeminism and Feminist Theory
sitting and organize others to demand toxic cleanups. When coupled with an environmental ethic that values rather than degrades nature, such actions have the potential both for raising women's consciousness of their own oppression and for the liberation of nature from the polluting effects of industrialization. For example, many lower-middle-class women who became politicized through protests over toxic chemical wastes at Love Canal in New York simultaneously became feminists when their activism spilled over into their home lives.6

Yet in emphasizing the female, body, and nature components of the dualities male/female, mind/body, and culture/nature, radical ecofeminism runs the risk of perpetuating the very hierarchies it seeks to overthrow. Critics point to the problem of women's own reinforcement of their identification with a nature that Western culture degrades.7 If “female is to male as nature is to culture,” as anthropologist Sherry Ortner argues,8 then women's hopes for liberation are set back by association with nature. Any analysis that makes women's essence and qualities special ties them to a biological destiny that thwarts the possibility of liberation. A politics grounded in women's culture, experience, and values can be seen as reactionary.

To date, socialist feminists have had little to say about the problem of the domination of nature. To them, the source of male domination of women is the complex of social patterns called capitalist patriarchy, in which men bear the responsibility for labor in the marketplace and women for labor in the home. Yet the potential exists for a socialist ecofeminism that would push for an ecological, economic, and social revolution that would simultaneously liberate women, working-class people, and nature.

For socialist ecofeminism, environmental problems are rooted in the rise of capitalist patriarchy and the ideology that the Earth and nature can be exploited for human progress through technology. Historically, the rise of capitalism eroded the subsistence-based farm and city workshop in which production was oriented toward use values and men and women were economic partners. The result was a capitalist economy dominated by men and a domestic sphere in which women's labor in the home was unpaid and subordinate to men's labor in the marketplace. Both women and nature are exploited by men as part of the progressive liberation of humans from the constraints imposed by nature. The consequence is the alienation of women and men from each other and both from nature.

Socialist feminism incorporates many of the insights of radical feminism, but views both nature and human nature as historically and socially constructed. Human nature is seen as the product of historically changing interactions between humans and nature, men and women, classes, and races. Any meaningful analysis must be grounded in an understanding of power not only in the personal but also in the political sphere. Like radical feminism, socialist feminism is critical of mechanistic science's treatment of nature as passive and of its male-dominated power structures. Similarly, it deplores the lack of a gender analysis in history and the omission of any treatment of women's reproductive and nurturing roles. But rather than grounding its analysis in biological reproduction alone, it also incorporates social reproduction. Biological reproduction includes the reproduction of the species and the reproduction of daily life through food, clothing, and shelter; social reproduction includes socialization and the legal/political reproduction of the social order.9

Like Marxist feminists, socialist feminists see nonhuman nature as the material basis of human life, supplying the necessities of food, clothing, shelter, and energy. Materialism, not spiritualism, is the driving force of social change. Nature is transformed by human science and technology for use by all humans for survival. Socialist feminism views change as dynamic, interactive, and dialectical, rather than as mechanistic, linear, and incremental. Nonhuman nature is dynamic and alive. As a historical actor, nature interacts with human beings through mutual ecological relations. Socialist feminist environmental theory gives both reproduction and production central places. A socialist feminist environmental ethic involves developing sustainable, non-dominating relations with nature and supplying all peoples with a high quality of life.

In politics, socialist feminists participate in many of the same environmental actions as radical feminists. The goals, however, are to direct change toward some form of an egalitarian socialist state, in addition to resocializing men and women into nonsexist, nonracist, nonviolent, anti-imperialist forms of life. Socialist ecofeminism deals explicitly with environmental issues that affect working-class women, Third World women, and women of color. Examples include support for the women's Chipko (tree-hugging) movement in India that protects fuel resources from lumber interests, for the women's Green Belt movement in Kenya that has planted more than 2 million trees in 10 years, and for Native American women and children exposed to radioactivity from uranium mining.

Although the ultimate goals of liberal, radical, and socialist feminists may differ as to whether capitalism, women's culture, or socialism should be the ultimate objective of political action, short-term objectives overlap. In this sense there is perhaps more unity than diversity in women's common goal of restoring the natural environment and quality of life for people and other living and nonliving inhabitants of the planet.
